# Penguins

Penguins are the bird who can't take flight. Many people think penguins don't qualify as birds. But they are, just because they can't fly they still qualify as birds. I'm going to teach you about penguins.

The reason they can't fly is, flying birds have light hollow bones and penguins have thick heavy bones weighing them down. This is why penguins can't fly.

Some people don't know that penguins can fly, under water they can fly. Penguins have their arms or flippers, which makes them able to reach high speeds chasing their food. Some penguins can swim under water for as long as twenty minutes and others longer.

Penguin lifestyle is very similar to humans. They eat, sleep, have children and more. Baby penguins can't go and hunt for food until they're old enough. So like a mama bird the parents pre-chew it for them.

Another part of penguin lifestyle is survival. The body fat keeps them warm in the arctic or other living areas.

they live in. Their body also helps them stay planted on the ice with their feet, claws, and flat tail.

Those are just some things about penguins. There's a lot more about them but it would get boring. And remember penguins can fly under water. The end.

Cheetas are amazing animals. They are fast, swift, sleek, and are very good at catching prey. This animal amazes hundreds of people by its amazing talents.

Cheetas have very keen eyes. They can see animals from a far distance away. If they see an animal running off in the distance they will be after that animal in a blink of an eye. Cheetas are not just good at seeing things but they are also good at hearing things too. If they hear you tip toeing a few feet away they could probably just hear you.

Cheetas are great at camouflaging themselves. Their brownish yellow fur helps them camouflage against rocks or sand. Also their black spots help camouflage them in the darkness.

Cheetas' fur is another way cheetas catch their prey so well. Another way cheetas catch their prey is their extreme speed that only lasts for a little while. Cheetas are the fastest land animal to live. They are so fast by putting their back legs in front of their front legs, then they push off with their hind legs that are now in the front of their body. Cheetas top speed is faster than a car on a highway, it is 70 miles per hour.

Cheetas are amazing animals but, they might become extinct. Cheetas

and many other animals need our help  
to save them from we started. Scientist  
and many other people have been helping  
save some of the animals, if it were  
not for them we might never hear  
these animals again. So, try to help save  
animals and make a difference, it will  
really help.
